

Domain Expertise

It refers to understanding the industry's processes, challenges, regulations, and best practices to deliver accurate and effective solutions.

Production

Logistics

Electronics

Healthcare

SME

Education

Warehouse

Field Service Operations

Services

Application Development & Implementation

We design and deploy customized business applications with strong database architecture, secure API development, and proper system configuration. Our team ensures smooth implementation along with user training to help organizations adopt the system effectively.

- Database Architecture
- API Development
- System Deployment & Configuration
- User Training

System Integration

Our integration services connect the new application with existing accounting systems and business tools. We provide reliable data import/export utilities and API-based connectivity to ensure seamless information flow across platforms.

- Integration with existing accounting software
- Data import/export utilities
- Basic API-based connectivity (where required)

Application Support

We provide ongoing support through bug fixing, performance optimization, version upgrades, and security patch management. Continuous monitoring and regular backups ensure system stability, data safety, and uninterrupted operations.

- Bug Fixing & Optimization
- Version Upgrades
- Security Patch Management
- Monitoring & Backup

Mobile Application Development

We develop user-friendly mobile applications that provide real-time visibility into shop-floor activities and production processes. These applications include live production dashboards, operational status updates, and performance monitoring tools. Secure login, authentication, and role-based access control ensure that users can access only relevant information based on their responsibilities.

solutions

Manufacturing Control System (MCS)

Our Manufacturing Control System is designed to streamline production operations by managing product structures, multi-level BOMs, and real-time inventory including available, reserved, and issued stock. The system supports job order planning and tracking, intelligent material allocation and reallocation, and daily production entry with shop floor monitoring.

- Product Master & BOM Management
- Inventory Management (Available / Reserved / Issued stock)
- Job Order Creation & Tracking
- Smart Material Allocation & Reallocation
- Production Entry & Monitoring
- Material Variance Reporting
- Basic Production Analytical

Hospital Information Management System (HIMS)

The Hospital Information Management System integrates outpatient and inpatient operations into a unified platform. It manages patient registration, treatment workflows, pharmacy inventory and billing, along with staff administration through human resource and payroll management. The system helps healthcare organizations improve patient service, ensure accurate billing, and maintain efficient administrative control.

- Outpatient Management
- Inpatient Management
- Pharmacy
- Human Resource Management
- Payroll

Library Management System (LMS)

The Library Management System automates all core library functions, including acquisition, cataloging, accessioning, and circulation activities. It supports stock verification, inter-library loan processes, master data management, and administrative controls. The solution improves resource tracking, reduces manual effort, and enhances overall library service efficiency.

- Acquisition
- Administration
- Cataloging
- Stock Verification
- Circulation
- Inter Library loan
- Administration

University Management System (UMS)

Our University Management System offers a centralized solution to manage the entire academic and administrative lifecycle. It includes student information management, human resource and payroll administration, financial operations, and facility utilization through space and infrastructure management.

- Student Information System
- Payroll system
- Human Resource system
- Finance Management system
- Space & Infrastructure Management System
- Generic Utilities

Logistics Solutions

Our Logistics Solution enables organizations to efficiently manage order processing, dispatch planning, and transportation operations. It supports route optimization, vehicle and fleet monitoring, real-time shipment tracking, and seamless coordination between warehouse and delivery activities. The system helps reduce operational costs, improve delivery performance, and increase customer satisfaction.

- Order & Dispatch Management
- Route Planning & Optimization
- Vehicle & Fleet Management
- Real-Time Shipment Tracking
- Warehouse & Inventory Coordination

Software Application Development

Custom Software Development

Custom Software Development focuses on building tailored applications that match specific business processes and operational needs. It begins with detailed requirement analysis and system design to ensure the solution aligns with business goals. Role-based access management ensures secure usage, while integrated reporting and analytics dashboards provide real-time insights for better decision-making and performance tracking.

- Requirement Analysis & System Design
- User Role & Access Management
- Reporting & Analytics Dashboard

Mobile App Development

Mobile App Development enables businesses to manage operations anytime and anywhere through user-friendly mobile applications. These apps support production tracking, secure user authentication through login, OTP, or biometrics, and instant push notifications for important updates. Performance monitoring tools ensure smooth operation, reliability, and a consistent user experience across devices.

- Production tracking apps
- User Authentication (Login/OTP/Biometrics)
- Push Notifications & Alerts
- App Performance Monitoring

IT Consulting

IT Consulting helps organizations plan and optimize their technology environment for efficiency and scalability. It includes infrastructure assessment to evaluate current systems, architecture planning for future growth, and selecting the right technologies based on business requirements. Process optimization ensures improved workflow efficiency, reduced operational costs, and better system performance.

- IT Infrastructure Assessment
- System Architecture Planning
- Technology Selection & Roadmap
- Process Optimization

Full-Stack Custom Software Development

Full-Stack Development provides end-to-end software solutions covering both backend and system-level operations. It includes building secure APIs and services, integrating with existing systems, and optimizing performance for speed and reliability. Continuous monitoring and logging help identify issues early, ensuring system stability, scalability, and long-term operational efficiency.

- Backend Development (API & Services)
- System Integration
- Performance Optimization
- Monitoring & Logging
